The emergence of local energy ecosystems

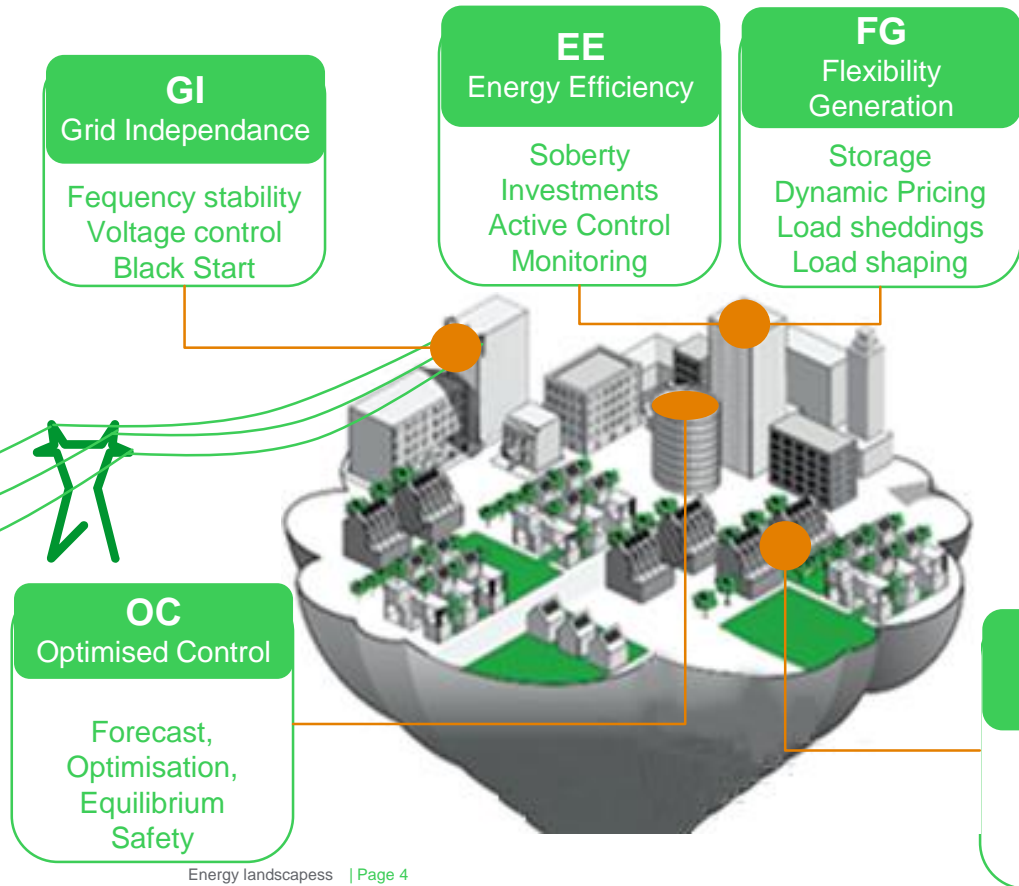

The changement drivers to « smart districts »

The motivations of big sites, campus, blocks, districts, local authorities, territories stakeholders

« Smart districts » are a five functional steps journey ...

.....et there is several routes.

	DG	EE	FG	OC	GI
Smart grid	X		X		
Positive Energy Buildings or territories	X	X			
Low carbon territory, Sustainable property	X	X		v	
Smart District Microgrid connected	X	X	X	X	
Microgrid OFF	X	X	X	X	X

Buildings
Efficient and Flexible

Building and sites impact

Demand Side Management (DSM)

Demand Response (DR)

dispatchable

Capacity/bidding

curtailments

stimulation

Virtual power plant (VPP)

urgency

Selective load shedding

Black out

Energy system control according to external incentive :
«Flexible building»

Non dispatchable

Dynamic pricing or
dynamic carboning

Time of use (TOU), Critical peak
pricing (CPP),

CO2 temporal grids

Energy system control in its own environment:
« Efficient building »

Energy Performance (EP)

Active Energy
Efficiency

Energy Soberty

Passive Energy
Efficiency

Control and monitoring

Behavior

Quality of assets

Occupancy control

Econometer for
individuals

Enveloppe

Service and machine
control

Infrastructures for
collective

Machines

Stakeholder dashboards

Energy and control architectures : a Russian Doll Scheme.

From occupant comfort to smart grids/ cities

City/ Territory

GRID

P : Production
R : Renewable
S : Storage
D : Distribution

Balanced

Impact on needed skills

(universities and engineer schools)

Almost no change on electricity

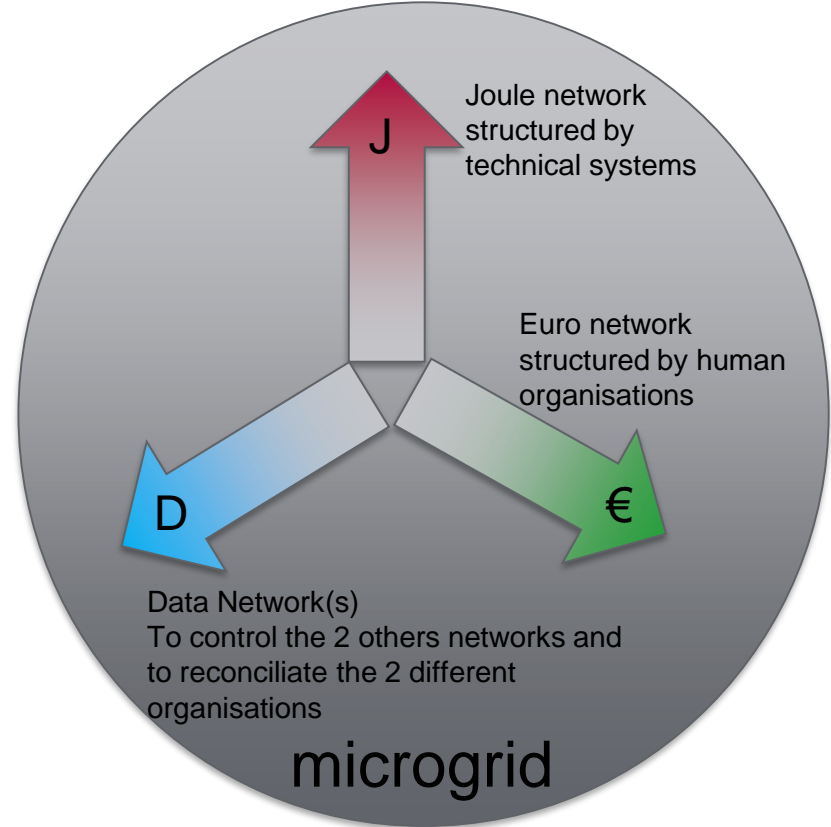

- but master fundamentals
- but inflate energy
- understand flexibility production/consumption

No change in finance

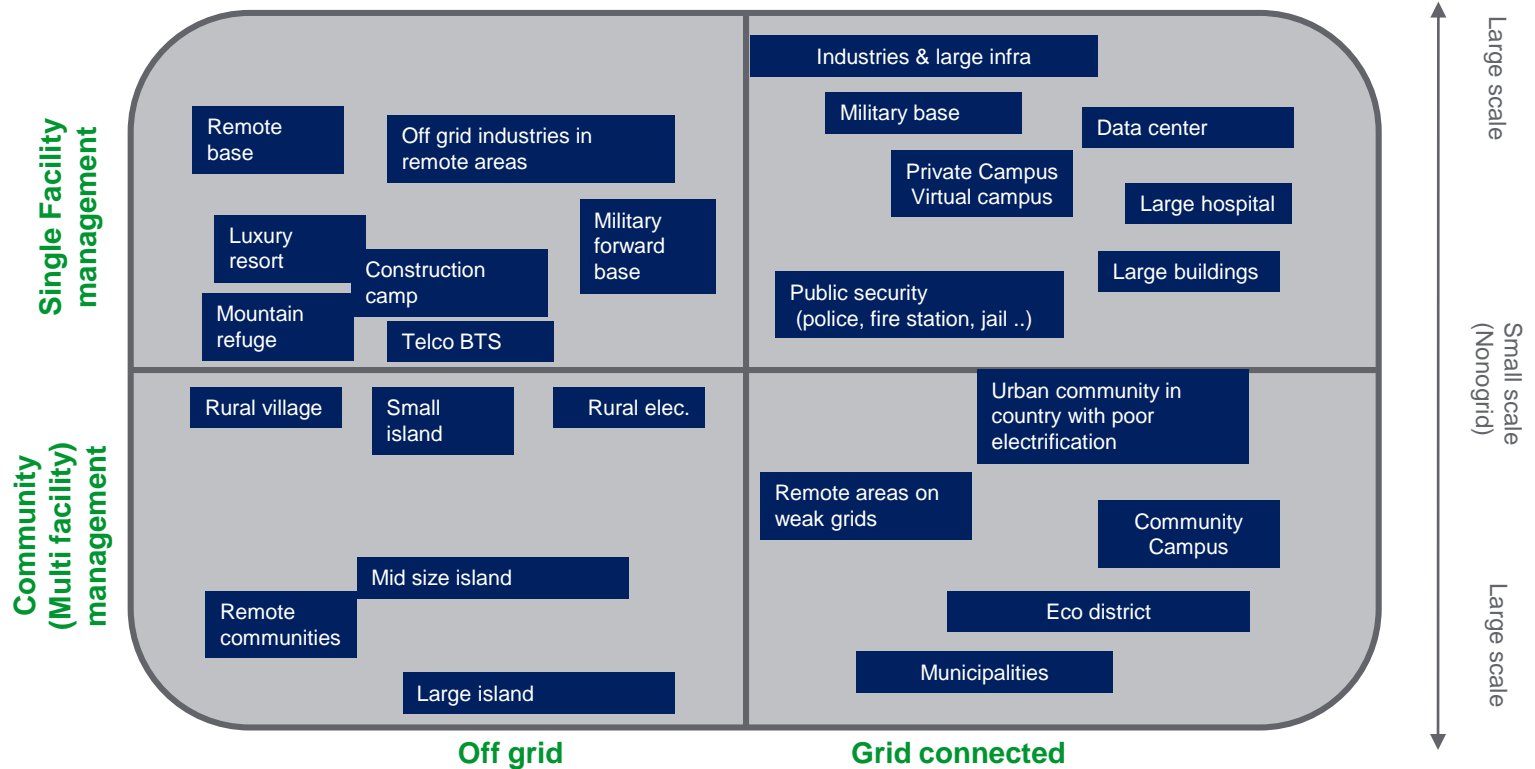

- but insist on « financing », involving grid codes influencing
- but insist on real time « value ».

Some changes in DATAs

- 2 Control architectures
- Property and analytics of datas
- From « big data » to « smart datas »

Microgrids classification (J, €)

THANK YOU

Life Is On
