# Market and regulatory barriers affecting the roll-out

- The STORY demos have showed that market liquidity is low even for simple technologies leading to long delivery times.
- Also maintenance and repair activities of implemented storage solutions sometimes are still very slow.
- The maturity of the technologies: components are OK, but trying to implement them in grid level is not mature yet
- Information gaps (permitters): Storage is not well taken into account in current regulations, and the permitting authorities do not know how to address storages.
- It is not very clear who are allowed to own and operate storages.
- Takes time before the clean energy for all package is implemented in the countries.
